

Chapter 3

How to retrieve data from a single table

Exercises

Enter and run your own SELECT statements

In these exercises, you'll enter and run your own SELECT statements. Your submission to your instructor should be a summary of everything you complete within this lab. Take screenshots of each output to show completion, but you only need to show screenshots for items that say "SCREENSHOT".

1. Write a SELECT statement that returns four columns from the Products table: product_code, product_name, list_price, and discount_percent. Then, run this statement to make sure it works correctly. SCREENSHOT

Add an ORDER BY clause to this statement that sorts the result set by list price in descending sequence. Then, run this statement again to make sure it works correctly. SCREENSHOT This is a good way to build and test a statement, one clause at a time.

2. Write a SELECT statement that returns one column from the Customers table named full_name that joins the last_name and first_name columns.

Format this column with the last name, a comma, a space, and the first name like this:

Doe, John

Sort the result set by last name in ascending sequence.

Return only the customers whose last name begins with letters from M to Z.

SCREENSHOT

3. Write a SELECT statement that returns these columns from the Products table:

product_name	The product_name column
list_price	The list_price column
date_added	The date_added column

Return only the rows with a list price that's greater than 500 and less than 2000.

Sort the result set in descending sequence by the date_added column.

SCREENSHOT

4. Write a SELECT statement that returns these column names and data from the Products table:

product_name	The product_name column
list_price	The list_price column
discount_percent	The discount_percent column
discount_amount	A column that's calculated from the previous two columns
discount_price	A column that's calculated from the previous three columns

Use the ROWNUM pseudo column so the result set contains only the first 5 rows.

Sort the result set by discount price in descending sequence. **SCREENSHOT**

5. Write a SELECT statement that returns these column names and data from the Order_Items table:

item_id	The item_id column
item_price	The item_price column
discount_amount	The discount_amount column
quantity	The quantity column
price_total	A column that's calculated by multiplying the item price by the quantity
discount_total	A column that's calculated by multiplying the discount amount by the quantity
item_total	A column that's calculated by subtracting the discount amount from the item price and then multiplying by the quantity

Only return rows where the item_total is greater than 500.

Sort the result set by item total in descending sequence. **SCREENSHOT**

Work with nulls and test expressions

6. Write a SELECT statement that returns these columns from the Orders table:

order_id	The order_id column
order_date	The order_date column
ship_date	The ship_date column

Return only the rows where the ship_date column contains a null value.

3 Exercises for *Murach's Oracle SQL and PL/SQL* (My Guitar Shop database)

7. Write a SELECT statement that uses the SYSDATE function to create a row with these columns:

today_unformatted	The SYSDATE function unformatted
today_formatted	The SYSDATE function in this format: MM-DD-YYYY

This displays a number for the month, a number for the day, and a four-digit year.

Use a FROM clause that specifies the Dual table. **SCREENSHOT**

8. Write a SELECT statement that creates a row with these columns:

price	100 (dollars)
tax_rate	.07 (7 percent)
tax_amount	The price multiplied by the tax
total	The price plus the tax

To calculate the fourth column, add the expressions you used for the first and third columns.

Use a FROM clause that specifies the Dual table. **SCREENSHOT**
